Many providers offering secure PDF hosting or enable you to secure PDF files online, but these are not as secure as you may think. Most cloud-based PDF DRM systems for example offer 'secure PDF hosting' but protect PDF documents online on a cloud server. Your unprotected PDF files are uploaded to a server where they are stored, encrypted and DRM controls applied, before being stored again in protected format. This may be fine for ebooks but what about sensitive and confidential company documents? Do you really want them sitting on a server in unprotected format for any length of time? Safeguard's PDF protection cloud-based PDF DRM system generates secure PDF files locally (encryption and DRM controls applied) and then uploads them to a cloud server so they can be viewed by users in a browser. Your PDF files can never be compromised by server vulnerabilities as they are encrypted locally, uploaded via SSL, and stored encrypted on the server. The important issue is not whether you can stop a PDF being copied but whether the recipient of the copied file can use it. If you encrypt a PDF with a password you can give a copy of the PDF to another user along with the password and they can use the file. So the protection provided is worthless as a useful copy was made that could be used with others. Safeguard effectively stops PDF copying because a copy of the protected file is of no use to another user without the decryption key to open it. Decryption keys are stored encrypted in a keystore which is locked to the device it was registered on - so only authorized users can open protected PDF files. Help is online only, but Sumatra PDF is such a simple program that we doubt you'll have any problems. Sumatra PDF - very quick, but extremely basic. Fixes for a few crashes. Changes Opens PDFs very quickly. Good for eBooks. Few extra features. Cannot create or edit PDFs. Safeguard PDF Security and Enterprise PDF DRM provide PDF protection by using encryption, DRM, and licensing controls. These document controls stop PDF sharing and printing, protect against copying, prevent editing, and enable secure distribution of your PDF files. Softonic review Sumatra PDF is a basic PDF viewer that aims to make viewing PDFs as quick and light as possible. In the world of PDF tools online, applications to view and edit can get bloated quickly. Stop PDF from being Forwarded / Emailed You cannot stop PDF files from being forwarded or emailed to others, but you can stop the recipients from using those files - see 'Stop PDF Copying' above. Lock PDFs to country locations, domains and IP addresses In addition to Safeguard's PDF protection of locking PDFs to individual machines so they cannot be used on unauthorized devices, you can also lock PDFs to specific countries, a domain or an IP address range. Disable or Prevent PDF Download Stopping PDFs being downloaded (the ability to disable or prevent PDF download) is very similar to the stop PDF copying principle. People think that if you allow users to view protected PDF documents online then they are more secure because they cannot be manipulated on a device outside of the 'secure environment'. You might want to think again. The way every browser works is by caching information to disk. And browser environments are possibly the least secure of all because if no software is installed on a device then you have no control over the actual environment (so stopping screen grabbing and printing to file drivers is not possible). See Secure Downloads for additional information on stopping downloads and copying. Safeguard also enables you to automate administrative functions (adding users, assigning document access) using our ecommerce API. This enables companies to delegate admin controls by creating simple interfaces where specific functions are made available, or for automating user creation and document access after a purchase has been made online (e.g. a protected PDF ebook). Users can still add comments to PDF files (if you allow this option), but PDF content is always protected from editing ensuring that your original content cannot be altered in any way. Stop PDF Printing / Protect PDF file from printing Safeguard protects PDF files from printing - it disables printing of PDF documents by default so you do not have to apply any additional controls to stop a PDF being printed. As well as using Safeguard to stop PDF printing for specific (or all) documents, you can stop printing on a user basis - you can disable PDF printing for some users but allow printing for others using the same protected document (you only have to protect the document once for all users rather than on an individual basis). Documents can be protected with zero prints available (to stop PDF being printed) and then individual users can be granted print rights by altering the number of prints available. Safeguard's installed Viewers enable users to download protected PDF files while enforcing all DRM controls so there is no need to disable or prevent PDF downloads. Protect PDF against content & text copying In some PDF protection products, if editing is disabled you can still highlight and copy text. Safeguard stops users from copying text and other content within a document - there is no copy paste option available and text cannot be highlighted for selection so it cannot be copied and pasted into other applications. For completely offline secure PDF distribution you can protect PDF files to USB sticks using Safeguard PDF Portable. This enables you to distribute our secure PDF Windows Viewer, secure PDF documents, and a keystore on USB sticks for offline viewing. Additional protected PDF documents and decryption keys can be added at a later date by authorized users when they become available without the USB stick having to be returned to you. Safeguard's PDF protection provides many security features and in-built restrictions to protect PDF files and unlike Adobe restrictions, these cannot be removed. Most of the basic protection features are applied by default (stop PDF copying, editing, screenshots, etc.) where others you can change to suit your requirements (allow or stop PDF printing, enforce expiry, etc.). All of these security restrictions enable you to stop PDF files from being shared with unauthorized users, and control how they are used and how long they are used by authorized users. A list of these PDF restrictions are provided below. Stop Screenshots / Protect PDF from screen capture Many PDF DRM products claim to stop screenshots but if you look closely they mainly claim to prevent Windows print screen. Unfortunately there are many free screen grabbing or screen capture applications available that users can download to easily bypass this restriction. This is useful if you want to check whether a particular user has viewed a document yet especially if they claim to have not received it. Tracking PDF files requires users to be connected to the Internet since a record has to be stored on a cloud server when a PDF file is viewed/applied. You may therefore only want to track PDF use for specific documents otherwise users will have to be constantly online. Safeguard's PDF protection disables print to PDF and other file printers so that if printing is allowed, users cannot print to PDF files, XPS, or any other file format. Most secure data room systems disable PDF download because the downloaded PDF files contain NO protection apart from a watermark that can be easily removed in a PDF editor. To stop the browser caching the PDF on the users system, they convert your PDF files to images when you upload them - so the document is no longer a PDF file but consists of just raster images. However, this provides a poor user experience since images are slow to display and print, and features such as search, bookmarks, and annotations are unlikely to be available. If you allow the user to download the PDF it is then converted back to a PDF file again. Stop PDF Editing / Lock PDF so it cannot be edited / Block PDF from editing Adobe Acrobat has 'security' features built-in that enable you to stop PDF editing (restrict editing PDF or stop PDF modifying), stop printing, and saving. To enable these features in Acrobat (and block PDF from editing) you have to apply a permissions password to protect the PDF. The problem however is that the password you set (no matter how long) is completely useless and is no more effective than putting a watermark on the document that says 'Please do not edit or copy this PDF'. This is because there are numerous free and paid for PDF password remover programs on the Internet that will remove Adobe Acrobat permissions passwords in seconds. So Adobe restrictions do not really enable you to disable editing in PDF files since PDF restrictions can be easily removed by users. It opens large files quickly and efficiently, and has a series of hotkey commands that make working with PDFs even easier. This is done at the user level or a global level (for all users). In this way you can easily restrict all users to viewing protected PDF files from say your office location in the US. This is particularly useful if users have laptops which they are allowed to take home - locked PDF files can then only be viewed at the office and not when the user is at home or at other locations where they could be shown to others. So to stop a PDF being copied / protect PDF from copying you have to encrypt PDF files to stop unauthorized access, use licensing controls to lock documents to devices, and DRM controls to control document usage so documents cannot be easily shared. Unlike Adobe watermarks or those added using other PDF editing tools, Safeguard's watermarks are permanent and cannot be easily removed. See How to remove a watermark from a PDF. A Safeguard protected PDF file can be forwarded and emailed to another user but the recipient will NOT be able to view it unless the document owner has authorized them to use it. Preventing Saving PDF / Save As If you are going to stop document sharing and editing then you have to stop Save As from being used so PDF documents cannot be saved in unprotected formats. The simplest way to do this is to not have the facility available to begin with. Some products use JavaScript to disable the Save As menu item or short-keys, but JavaScript can be easily removed (or turned off) in a browser environment and so cannot be used securely. To discourage users making copies of protected documents, you can add dynamic PDF watermarks to viewed and/or printed content. By using dynamic variables, you only have to protect a PDF once for all users (rather than watermarking and protecting each document individually

for each user in Adobe Acrobat) as user data (name, company, email, date/time, etc.) is inserted at view/print time. Safeguard's PDF watermark lets you position watermarks anywhere on the page (including custom locations), and choose your own font and color. You can use different watermark marks for viewed and printed documents and both text and image watermarks are supported. PDF watermarks can be displayed behind content (so they are less obtrusive to the user) and you can choose not to display watermarks on the first page of a document if you have a cover image that you want to leave unmarked. Track PDF use Safeguard Enterprise PDF DRM lets you track PDF use so you can see when users have viewed and/or printed your PDF files. Stop PDF Copying / Protect PDF against copying & distribution How can you stop PDF copying since anyone can easily copy a digital file? Of course, to be so streamlined it has few configuration options and won't let you edit or create documents, but if you only want to view the occasional PDF, it will do the job really well.Great language options and good zoom and search functions are two extra features that add to Sumatra PDF's good points. However, if you encrypt a PDF file and the user does not have the decryption key to use it then it does not matter if they can download it. They won't be able to open it anyway. And if you apply DRM and licensing controls then authorized users (those given access) will be restricted as to what they can do with downloadable PDF files (for example not being able to share them with others). So the ability to download a PDF file does not make it any less secure - in fact, many online PDF Viewers that 'prevent downloads' are less secure since they decrypt PDF files on the server and deliver (download) them to the client in unprotected form. Unlike Adobe Acrobat Reader, Safeguard's PDF protection has no Save or Save As functionality in our secure PDF Viewer software. The only documents that can be copied are protected PDF files and they are useless to unauthorized recipients as they need the correct decryption keys to open them. PDF Expiry and expiring PDF files Safeguard enables document publishers to expire PDF files so they can no longer be used after a certain amount of time. The following options are available: expire documents on a fixed date expire documents after a number of days expire documents after a number of opens or views expire documents after a number of prints These options can be used together so that you can enter a number of days/views/prints and a fixed date and whatever occurs first causes the document to expire. You might for example want a user to be able to use your documents for a 15 day trial period but those documents will expire on a fixed date regardless if the trial period is used or not. Expiry dates can be changed on the administration system at any time and document publishers can increase the number of views/prints available for each user. Many cloud based systems claim to stop PDF forwarding - however users can share their login credentials with others so they have access to your documents anyway. If a system uses document links then there is nothing stopping an authorized user emailing those links to other users along with the login information. Some systems state that they lock PDF files to email addresses or domains but that just means that you have to login using that email address or any email address that belongs to the domain. It does not stop PDF forwarding since authorized users can still give their login credentials to others. That is also true of 2FA codes which provide little extra protection. If you allow printing, you can limit the number of times a PDF can be printed by each user in order to stop users distributing high quality copies of documents to others. You can also enforce black & white or grayscale printing of color documents. Document watermarking is recommended if you allow printing to discourage photocopies being made - see PDF watermarking below. Safeguard enables you to revoke PDF files instantly (the document must be set to check with the administration system each time it is opened), or you can revoke users so all documents they have access to become inaccessible. If you have created PDF files that only check with the administration system every n days then PDF revocation will only take place once a check has occurred. With Safeguard, PDF files can be revoked no matter where they are located. You can also revoke access to multiple PDF files instantly and group documents into publications to make revocation easier for common groups of documents. If you prefer to host secure PDF files yourself then you can distribute them just like any other file (email, USB, web site download, etc.). Safeguard generates PDC files (secure PDF format) that can only be opened with our secure PDF Viewers. It does not matter who has access to your secure PDF files because they are encrypted and can only be viewed by authorized users. So you can make them freely available via a web site for download without worrying about password access controls. If you are the document publisher, you can email protected PDF files to users knowing that if they fall into the wrong hands they cannot be opened. So if a protected PDF is accidentally forwarded to the wrong person they will not be able to use it. See also stop copying, downloading and emailing. Secure PDF Hosting & Secure PDF Distribution Locklizard provides secure PDF hosting with Web Publisher (protected PDF files are stored on a cloud server either hosted by Locklizard or yourselves) or you can distribute PDF files securely as you would any other file. Batch PDF Protect with command line Safeguard enables you to batch protect PDF files using a command line tool. By using this PDF security tool multiple administrators can protect PDFs in a consistent manner, apply PDF protection quickly and simply to multiple folders, and schedule PDF protection based on certain events or a date/time. Using command line, administrators don't have to learn what DRM security controls to apply - they just run a batch file. Because Save As options are not made available, Safeguard's Secure PDF Viewers automatically stop PDF converting to Word and other file formats. Protected PDF files (PDC files) cannot be converted to Word using external applications as the files are encrypted and can only be processed by Safeguard Secure PDF Viewers. Safeguard does not use passwords to protect PDF files since they can be easily shared or removed. Instead PDF files are protected using individual encryption keys that are securely and transparently relayed to authorized devices from a web server and stored encrypted in a keystore on the local device. The keystore is locked to individual devices so it cannot be copied and moved elsewhere. Safeguard stops PDF editing / modifying by default - it will lock a PDF so it cannot be edited and blocks all forms of content copying. There is no option that can be enabled in our Secure PDF Viewers for users to edit PDF files or copy/paste PDF content thus protecting PDF files from editing. By disabling editing of PDF files you also stop content copying / text copying. Safeguard Secure PDF Viewer also disables editing of PDF forms - so form content (fields) cannot be edited or modified in any way, but form fields can still be filled in - see secure PDF forms. The more features you add, the slower the programs become a problem that blights lots of otherwise excellent applications.Sumatra PDF aims to overcome this by cutting out almost all of the features that weight other PDF editors and viewers down. Revoke PDF Files Being able to revoke PDF files is an important part of any document security solution. There may be times when the wrong document was published, a user has left your company, or you think a specific document has been compromised. PDF Watermarking No DRM system is fool-proof. Even if screenshots are prevented, users can take photographs of the screen using a camera. Similarly, if printing is allowed, users can print and scan back in printed documents. The administration system (where you create users and authorized document usage) can be hosted by Locklizard or on your own servers. This is separate from protecting PDF files (locally on your computer) so you have greater control over secure PDF distribution of your documents and who has access to them. Safeguard stops screenshots being taken by common third party software applications. It uses many different methods including a screen mask that is overlaid over the protected PDF document if the mouse cursor is moved to another active application. No PDF DRM product however can stop all screenshots (users can just take photographs of the screen) so it is recommended that document publishers apply dynamic watermarks as a copying deterrent. If a user's name and email are displayed on a screen shot then they will probably be less likely to share it with others (especially uploading it to the Internet where they can be easily identified). To protect PDF files from content copying see the section entitled "Protect PDF against content & text copying". Authorized users must be prevented from saving the PDF in unprotected format (so no editing or saving options should be made available) and unprotected files should never be stored on disk in temporary files where they could be easily recovered. For additional security the PDF Reader should prevent screen grabbing, and document owners should disable printing so photocopies cannot be made of printed documents. Safeguard's secure PDF Viewer is required to open protected PDF files. This can either be installed on a device (Windows, Mac, iOS, Android), run from a USB stick (completely offline zero installation solution), or accessed via a web browser (zero installation). When a user opens a protected PDF document the Viewer checks to see if the decryption key is available. If it is not present then the Viewer checks with the administration server to see if the user is authorized to view the protected PDF. If they are, the decryption key is transparently relayed to the client and the protected document opens. DRM controls are enforced by the Viewer software.
